WE CLAIM AS OUR INVENTION:

Claim 1 (cancelled).

2. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material; and

The method of claim 1, further comprising forming an opening in the ceramic matrix composite material to receive the bond enhancement element.

3. (currently amended) The method of claim ~~1~~ 2, further comprising forming ~~an~~ the opening in the ceramic matrix composite material when the ceramic matrix composite material is in a bisque fired stage.

Claim 4 (cancelled).

5. (currently amended) The method of claim ~~1~~ 2, further comprising co-firing the ceramic matrix composite material and the ceramic coating to interlock the bond enhancement element there between.

10/631,277

6. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material; and

~~The method of claim 1,~~ further comprising inserting the bond enhancement element into the ceramic matrix composite material when the ceramic matrix composite material is in a dry perform stage prior to infiltration of matrix material.

7. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material;

~~The method of claim 1,~~ further comprising:
embedding a bond enhancement element into a compressible material; and
compressing the compressible material between a tool and the ceramic matrix composite material to drive the bond enhancement element partially into the ceramic matrix composite material.

10/631,277

8. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material;

~~The method of claim 1, further comprising:~~

forming a tool comprising a fugitive material having particles of a bond enhancement material partially embedded on a surface of the tool;

applying a force between the tool surface and a surface of the ceramic matrix composite material to partially embed the particles of bond enhancement material into the surface of the ceramic matrix composite material; and

applying heat to at least partially cure the ceramic matrix composite material and to remove the fugitive material, exposing that portion of the particles of bond enhancement material not partially embedded in the surface of the ceramic matrix composite material.

9. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material;

~~The method of claim 1, further comprising:~~

partially embedding a layer of particles of a bond enhancement material into a surface of a layer of a mold release material; and

applying a force between the surface of the mold release material and a surface of the ceramic matrix composite material to partially embed the particles of bond enhancement material into the surface of the ceramic matrix composite material.

10/631,277

10. (currently amended) A method of fabricating a composite structure, the method comprising:

partially embedding a bond enhancement element into a ceramic matrix composite material;

applying a ceramic coating to the ceramic matrix composite material over that portion of the bond enhancement element not embedded in the ceramic matrix composite material;

~~The method of claim 1, further comprising:~~

forming a lower tool comprising an opening extending through a thickness of the lower tool from a pressure surface to a work piece surface;

forming an upper tool comprising a drive element extending from a pressure surface, the drive element sized to fit into the lower tool opening;

inserting the bond enhancement element into the lower tool opening;

applying the lower tool work piece surface to a surface of the ceramic matrix composite material;

aligning the upper tool and the lower tool so that the drive element extends into the lower tool opening; and

urging the upper tool against the lower tool to drive the bond enhancement element partially into the ceramic matrix composite material.

11. (original) The method of claim 10, further comprising selecting a length dimension of the drive element extending from the upper tool pressure surface so that the bond enhancement element is only partially embedded into the ceramic matrix composite material when the pressure surface of the upper tool contacts the pressure surface of the lower tool.

10/631,277

12. (original) The method of claim 10, further comprising forming the opening in the lower tool to comprise an upper portion comprising a first width dimension proximate the pressure surface and a lower portion comprising a second width dimension smaller than the first width dimension proximate the work piece surface; and

forming the drive element to have a width dimension between the first width dimension and the second width dimension so that the drive element will bottom out in the upper portion during the step of urging the upper tool against the lower tool.

13. (original) The method of claim 10, further comprising:

removing the upper tool and the lower tool to expose the bond enhancement element partially embedded into the surface of the ceramic matrix composite material; and

applying a ceramic thermal insulation material over the surface of the ceramic matrix composite material to embed that portion of the bond enhancement element not embedded into the ceramic matrix composite material.

Claims 14-19 (cancelled).

20. (original) A method of fabricating a composite structure, the method comprising:

forming a ceramic insulation material having a bond enhancement member partially embedded within and partially extending beyond a surface of the ceramic insulation material; and

using the surface of the ceramic insulation material as a mold for forming a ceramic matrix composite material to embed the portion of the bond enhancement member that extends beyond the surface of the ceramic insulation material.

10/631,277

21. (original) The method of claim 20, further comprising:
forming a mold of a fugitive material having particles of a bond enhancement material partially embedded in a surface; and
using the mold to form the ceramic insulation material to have the bond enhancement particles partially embedded therein.

Claim 22 (cancelled).

23. (previously presented) A method of fabricating a composite structure comprising:
forming a ceramic matrix composite substrate by laying up a plurality of layers of ceramic fibers and infusing a ceramic matrix material into the fiber layers;
forming a plurality of bond enhancement elements as waves on a top surface of the ceramic matrix composite substrate by inserting solid shapes between layers of the ceramic matrix composite substrate;
forming a ceramic coating on the top surface of the ceramic matrix composite substrate to mechanically engage the bond enhancement elements; and
further comprising forming the solid shapes of a fugitive material.

24. (previously presented) The method of claim 23, further comprising:
forming the ceramic coating to comprise a plurality of ceramic spheres; and
forming the bond enhancement elements so that a distance between a top and a bottom of the waves is at least one half an average diameter of the spheres.
